## SUMMARY

This year's wheat market is characterized by continued strong export demand and a pullback in domestic demand. It now appears that exports will total 1.1 billion bushels, not much below the 1972/73 record, and year ending stocks are expected to hold near last year's low level. But with a more orderly export scene, the experience last year of operating with minimum stocks, and a free-flowing transportation system, the market has been far less volatile than last year. The reported cancellation of some export sales and the modification of the voluntary export reporting system do not appear to give a reason for changing the export estimate.

Wheat disappearance during July-December 1974 at 942 million bushels was one of the heaviest on record, although restrained compared to last year's torrid rate. A sharp falloff in wheat feeding and a steadier pace of exports both contributed to the decline from last year. As a result, prices paid to farmers were less volatile and the transportation system was under less stress.

But what about the second half of the marketing year? The January 1 stocks of 1.1 billion bushels must satisfy demand until new crop wheat becomes readily available. The export pace is expected to continue heavy. If current projections hold up, roughly half the January 1 stocks should be exported by June 30. The domestic milling industry will grind another fourth. Seed and feed requirements will account for around 5% of the total. The remaining 20% or 250 million bushels will be this summer's old crop stocks.

Early indications suggest that U.S. wheat farmers may be setting the stage for the third consecutive record wheat harvest. Winter wheat producers, responding to strong prices and an open ended wheat program, increased plantings 6%. In just 2 years, acreage is up over a fourth and the largest since 1953. Based on December conditions, which were generally good, a record 1.6 billion bushel winter wheat crop could result.

Last spring, adverse weather and an uncertain price outlook discouraged spring wheat producers from completely fulfilling their planting intentions. This year they appear to be holding down intentions as the January report indicated a slightly smaller spring wheat acreage.

The larger total wheat acreage and average weather could produce a 1975 crop of more than 2 billion bushels. But what about demand? With world grain

stocks shrinking further, export demand for wheat in 1975/76 is again expected to be heavy. Tight feed grain supplies this summer could push up wheat feeding and result in total domestic use of over 800 million bushels. But even with a record demand, there would be some stock cushion. Should yields falter again, however, stronger prices and shorter supplies would cut wheat feeding and limit exports.

*Hard Red Winter (HRW):* After a fairly quiet first 6 months, HRW exports will finish with a rush. By this summer over 60% of the January 1 stocks of roughly 550 million bushels could be exported. Feed use of HRW has slipped noticeably, but mill grind has picked up in response to current high spring wheat prices. The strong demand is expected to prevent any rebuilding of HRW stocks this year. Farmers seeded 7% more acreage to HRW this past fall and if favorable weather holds, the 1975 crop could be 10 to 15% above last year's weather-reduced outturn.

*Soft Red Winter (SRW):* The expansion in the 1974 SRW crop has been matched by a surge in export demand. Exports zoomed, pushing total disappearance for July-December to near 200 million bushels, nearly double the year-ago level. Demand for January stocks of over 100 million bushels should continue strong during the second half. However, this would still leave stocks by this summer somewhat larger than a year ago's level of 9 million bushels. SRW producers continue to view wheat as a profitable part of their cropping operations as they indicated another sizable acreage increase this past fall. With help from the weather, the 1975 crop could easily top 300 million bushels.

*Hard Red Spring (HRS):* After 2 exceptionally heavy

years, domestic milling of HRS has slowed this year. A smaller supply and high prices have reduced the attractiveness of HRS. With higher protein wheats commanding a substantial premium, there has been a tendency to blend less HRS with lower protein winters. Export demand has been good, aided in part by the poor quality crop in Canada, our chief competitor in the world's protein wheat market. HRS wheat stocks this summer could slip some from the 66 million bushels of a year ago. Farmers' planting intentions as of January 1, show slightly less HRS acreage for 1975.

*Durum:* With durum prices running well over hard wheats, the demand for durum has slowed. The pace of durum exports has slackened and durum mill grind is down this marketing year. Mill grind appears to be running about 15% behind the July-December 1973 rate. For the second 6 months, mill grind may continue at that subdued pace. Seed use should expand slightly and additional export sales may push the total for the year to around 35 million bushels. High durum prices, particularly in relation to HRS, were probably the basis for the indicated 10% increase in 1975 plantings.

*White wheat:* Demand for white wheat was strong during the July-December period, but is expected to slow noticeably during the second half. Export demand has been good, with a larger than usual share being eastern white wheat. Outstanding export sales at midyear, at around 45 million bushels, are only around half the hoped-for sales. But a pickup is expected, and with normal second half domestic use, stocks this summer should total around 20 million bushels. Dry weather hindered wheat seedings in the Pacific Northwest.

## THE CURRENT SITUATION

### July-December Disappearance Off; Second Half Expected to be Heavy

Wheat disappearance during July-December 1974, at 942 million bushels, was well off the frantic pace for the same period a year ago, which was the heaviest for any 6 months in history. A number of factors accounted for the reduction. A sharp reduction in the number of cattle on feed and high wheat prices relative to other grains led to a sharp reduction in wheat feeding. Consequently, feeding at only around 55 million bushels during the first 6 months was the smallest since 1967/68. This was in sharp contrast to the recent trend toward expanded wheat feed use.

Exports during July-December 1974 were also down from the extremely heavy pace a year earlier. A sharp falloff in shipments to the USSR and the People's Republic of China accounted for most of the decline. Larger purchases by India and Iran have taken up some of the slack.

Requirements for seed wheat continue to grow as farmers appear to be expanding acreage to its highest level since the early 1950's. (For additional details see section on "Outlook for 1975/76").

The hopes for a reversal in the decline in per capita consumption of wheat products appears to be at least temporarily dashed. Estimated domestic food usage during July-December at 273 million bushels was fractionally below the 1973 period. At least part of the fall off in mill grind this year may be explained by the unusual pattern of the 1973/74 crop year.

A heavy mill grind during July-December 1973, without a corresponding pick up in flour export, implied a sharp increase in domestic consumption. Data for the January-March 1974 quarter seemed to confirm this development. However, mill grind slumped in April-June and continued below year earlier levels until October. It now appears that the apparent increase in consumption during 1973/74 may have been at least partially an illusion resulting from the absence of data on flour

**Wheat: Supply and distribution**

<b>Total disappearance .....</b>	<b>1,216.9</b>	<b>942.4</b>
January 1 stocks .....	927.3	1,099.8

stocks from mill to kitchen. Consequently, if 1974/75 food use edges up, it will be due to a return to more normal March-June usage. At best it appears that any increase will reflect only population growth rather than an increase in per capita consumption.

With disappearance during July-December 1974 at a lower level than the past 2 years, January 1, 1975 stocks

were actually 19% larger than last year's even with a smaller beginning supply. But the increase in stocks looks insignificant when compared with projected demand for the rest of the marketing year. Unlike 1973/74 when January-June demand fell sharply, it is expected to be exceptionally heavy this season. Exports will lead the way with shipments projected at around 550 million bushels, only slightly below the strong first half level. Much of this was already booked with outstanding sales as of December 29, 1974 at 430 million bushels. New sales continue brisk as weather reduced crops in some of our competing exporting countries encourage importers to turn to the United States as a wheat supplier. Continued strong wheat prices and fewer animals on feed are expected to limit wheat feeding, while both food and seed use may hold near last year's level.

Where will the market turn to find the wheat to meet January-June needs? Of the 1.1 billion bushels in stock on January 1, around 440 million bushels were held on farms. The majority of this was located in 6 States, Kansas, North Dakota, Montana, Minnesota, Nebraska, and South Dakota. The remaining 660 million bushels are scattered from country elevator to terminal to the export facility or mill. Indications would suggest that farmers also own substantially more of the off-farm stocks than usual.

## Will July 1 Stocks be the Lowest in Over a Quarter of a Century?

It now appears that the answer could be, maybe. For the 1974/75 crop year, total disappearance is expected to total around 1.8 billion bushels. This would be the third heaviest disappearance on record, only slightly below the level of the past 2 years. The weakness in domestic use this year can be traced to the reduction in feed usage. The continued strong export demand has propelled the export projections to 1.1 billion bushels, which approaches the record of 1,186 million bushels set in 1972/73. If these projections are realized, stocks this summer would total around 250 million bushels, basically unchanged from a year earlier. Thus, 1975/76 would be the second consecutive season with old crop carryin equal to about half of our annual domestic food needs.

### Wheat Prices For the Season to Average Higher

In the November 1974 *Wheat Situation* several reasons were cited for expecting continued strong wheat prices for the balance of the marketing year. Although off substantially from the November high of \$4.87 per bushel, prices at the farm are still running around \$4.00 per bushel. Many factors mentioned earlier are still influencing market prices:

1. Preliminary estimates point to a record 1975 wheat crop. The winter wheat crop has been estimated at 1.6 billion bushels and spring wheat planting intentions are just a little under last year's. It seems that a harvest of at least 2.0 billion bushels is quite possible. Market watchers will watch Mother Nature carefully after last year, when she dealt the 1974 crop a staggering blow.

2. The level of export shipments is of special significance since we no longer have stocks to dip into if an unexpected import need arises. Through January, sales (exports plus outstanding sales) totaled just over 1 billion bushels, compared to our export projection of 1.1 billion. This contrasts sharply with the situation 12 months ago when prospective sales of over 1.3 billion bushels, compared with USDA's export projection of 1.0 billion, led some to believe that the wheat supply had been oversold. This caused a highly chaotic and volatile market, which saw wheat prices at the farm reach a high of \$5.52 per bushel in February then drop to \$3.52 per bushel just 3 months later. A different pattern of export sales this year and the recently established voluntary system for reporting daily export sales have tended to take away much of the uncertainty that shrouded the market last year. This system was modified in late January 1975, so that the wheat exporter would now have to report within 24 hours, sales to any country or destination totaling 100,000 tons in any calendar day or

200,000 tons cumulative for a calendar week. This action doubles the quantity that an exporter can sell to one destination without reporting the sale to the Government within 24 hours or seeking prior approval<sup>1</sup>

3. The pace of export shipments during January-June 1975 must be brisk, averaging over 20 million bushels weekly, if the 1974/75 export estimate of 1.1 billion bushels is to be reached. Exporters' procurement of this much wheat should prop up wheat prices and prevent a sharp drop similar to that which occurred in the spring of 1974.

4. The transportation system appears able to move grain from the producing areas to the user with less difficulty this year. Last year the Plains States were unable at times to move wheat to demand points. However, there have been backups from ports this year due to slow ship arrivals.

5. The marketplace has had a year's experience of operating with minimum stocks; consequently, the prospects of only 250 million bushels in stock on July 1, 1975 is not as frightening.

What's to prevent a repeat of last year's sharp price rise in late winter and even sharper fall in March and April? A recurrence is not impossible but the above mentioned factors make it less likely. In summary, wheat prices between now and July 1 should continue strong, rising and falling as each of these factors take turns dominating the marketplace.

#### Loan Activity Negligible

Another year of strong prices, record incomes and higher interest rates on wheat loans are lessening the farmer's dependence on the price support loan program as a marketing tool. Through December less than 35 million bushels of the 1974 crop had been put under loan. This contrasts sharply with the experience in 1971 when prices were low and farmers turned to the loan program in droves and by December over 350 million bushels went under loan (table 7).

Gross farm value of wheat<sup>1</sup>

Crop year	Value of production	Government payments	Gross value
	Million dollars	Million dollars	Million dollars

<sup>1</sup> Excludes set aside and disaster payments.

<sup>1</sup> See discussion of export reporting system page 10 November 1974, *Wheat Situation*.

#### 1974 Crop Value Sets New Record

In December, the USDA estimated the average price received by farmers for 1974/75 at \$4.32 per bushel, 36 cents above last year's record. This is well above the target price; consequently, no deficiency payments were made on the 1974 wheat crop.

The value of the 1974 wheat crop is estimated to reach a new record of \$7,723 million. This tops last year's record buster by half a billion dollars. Detracting from this record gross income is the sharp climb in the cost of producing wheat, particularly spring wheat.

#### Value of Wheat Exports Soar

Not only has wheat been an important income source for the farmer, but for the United States as well. In 1973/74 our near record wheat exports accounted for approximately 45% of the world's wheat trade. Wheat exports contributed a record \$4.7 billion to the total value of U.S. exports of agricultural products during that year.

Wheat: Value of exports, 1950-74

Year	Wheat and wheat products	Year	Wheat and wheat products
	Million dollars		Million dollars
1950 .....	685	1963 .....	1,161

1961 .....	1,155	1974 .....	4,739
1962 .....	1,288		

#### CCC Announces New Resale Policy

Traditionally CCC's resale price of wheat has been based on the price support loan, plus a certain percentage markup, plus charges for maintaining and moving the grain. This policy was revised on November 27, 1974. Until further notice the minimum CCC resale price of wheat per bushel (not including carrying charges) will be \$2.36. This established rate of resale will assure producers that in the event that the CCC again owns wheat, it will not be sold at prices below the target level.

#### Record Average Bread Prices in 1974

In 1974, the price of white pan bread sold in food stores averaged a record 34.5 cents per 1-pound loaf, 6.9 cents or 25% higher than in 1973. At first glance this

rate of increase would appear to be a record. But not so! Prices were high going into 1974 and although they moved higher during the year, the biggest price jump occurred in the last half of 1973. Had 1974 prices not changed from the January level, the average would have still been 4.3 cents higher than the 1973 average. The average retail price in the fourth quarter of 1973 was 31.3 cents, 6.6 cents higher than the year earlier. The fourth quarter 1974 average was 4.6 cents higher than during the same quarter a year ago.

Changes in marketing spreads between the last quarters of 1973 and 1974 varied for each production and marketing function. The only item which increased every quarter was the "other spreads" category, which

goes mainly for transportation and nonflour ingredient costs.

The retailer's price spread increased in the second and fourth quarters of 1974 but the fourth quarter still averaged 0.4 cent less than the same period in 1973. The baker-wholesaler's price spread jumped 2.7 cents in the second quarter but narrowed in other quarters, bringing the end of year average to 1.6 cents higher than 1973's.

The table below summarizes changes in average prices and price spreads for specified periods. With the recent easing of ingredient prices and prospects for a record 1975 wheat crop, it appears that the rate of increase in bread prices in 1975 will likely slow from the pace during the last year and a half.

White pan bread: Changes in prices, spreads, and farm values of ingredients per one pound loaf by quarters and other specified periods in 1974

Item	1974 changes from previous quarter				Changes in 1974

## OUTLOOK FOR 1975/76

### Early Indications Point to Another Record Winter Crop

High wheat prices, prospects for continued strong demand, and open-ended wheat program, and good fall planting weather all point to a large 1975 wheat acreage. Most of these same factors were in evidence a year ago when farmers responded with a 21% increase in acreage for the 1974 crop.

However, strong prices for other crops, higher input prices, technological restrictions, cultural practices, weather, and the land supply itself are factors which will limit the expansion in 1975 wheat acreage.

Weather so far appears to be supporting another increase in acreage this season. Last fall, weather for seeding wheat in the Central and Southern Plains was better than a year earlier. The drought and early freeze in the western and northern Corn Belt resulted in more corn harvested for silage than normal thus adding acreage to the potential winter wheat area. On the other hand, persistent dry conditions in the Northwest and the Northern Plains limited the acreage expansion there.

In general, winter wheat growers responded as expected. Total winter wheat acreage, at 55.5 million

acres, was 6% more than a year earlier and the largest since 1953. Seedings were up a whopping 16% in Texas, 24% in California, 34% in Arkansas, and 14% in Missouri. The early frosts and harvests in the upper Corn Belt probably are the main reasons for winter wheat acreage increasing 41% in Minnesota and more than doubling in Iowa to 110,000 acres.

Based on crop conditions as of December 1, 1974, winter wheat production was forecast at 1.6 billion bushels, 15% above the 1974 level. Of the 3 major winter wheat classes it appears that the greatest production gains will come in HRW and SRW. Moisture conditions in most areas have improved since planting time and winter wheat prospects have been generally bright. Heavy snowfall in early January brought much needed protection and moisture to the Northern Plains area. As of late January, the crop in the major winter wheat States continued in good condition.

### More Durum Acreage Indicated But Less Other Spring

Last year the spring wheat producer was faced with falling prices and adverse planting weather, and actual

Prices of Wheat Futures Contracts, March and Sept.

Item	March			Sept.		
	Season		Jan. 24	Season		Jan. 24
	High	Low		High	Low	
	<i>Dollars per bushel</i>					
Kansas City . . . .	5.43	3.56	4.04	4.89	3.62	4.00
Chicago . . . . .	5.56	3.50	4.05	5.13	3.59	3.98
Minneapolis (HRS) . . . . .	5.73	4.14	4.44	4.53	3.83	4.12
Minneapolis (Durum) . . . . .	7.35	6.45	5.80	6.00	6.00	5.80

1974 planted acreage fell 4% below the March planting intentions of 19.6 million.

While the price outlook has again weakened, the futures prices next spring and summer still indicate a strong market. Planting intentions as of January 1 indicated that spring wheat producers will cut plantings about 2%. Growers indicated a 10% increase in durum acreage, apparently in response to high prices of durum relative to HRS. The largest increase in durum acreage was in North Dakota and Montana. Only 2 States, Minnesota and South Dakota, indicated larger plantings of other spring wheats. Overall, the intended acreage for other spring wheat is 4% below 1974 plantings.

Yields may again be subject to wide fluctuations due to the large acreage. Last year saw yields drop to their lowest level since 1967. If weather during the 1975 growing season is more normal, harvested yields could be expected to fall within a range of 26 to 30 bushels per acre.

**Record Crop Possible: Demand Likely to Continue Strong**

The larger acreage with average weather could produce a 1975 crop of more than 2 billion bushels. However, should the growing season again be as bad as last year's, the 1975 harvest would probably differ little from 1974's 1.8 billion bushels.

But what about demand? If the record demand in 1972/73 was a surprise, the continuation of exceptional heavy demand in 1973/74 may have been an even greater surprise. Now 1974/75's demand appears almost as strong. And with world grain stocks continuing to shrink, demand for wheat in 1975/76 is again expected to be heavy.

Expected small world wheat stocks, the increasing pressures of world population, and continuing shifts from other food staples to wheat should hold world demand for U.S. wheat in 1975/76 near the high level of the preceding 3 years.

High feed grain prices, and tightening supplies could result in much heavier first half wheat feeding than this season's 54 million bushels. This, along with our relatively inelastic demand for food, could push

domestic use over 800 million bushels, compared with this season's 700 million.

Given these conditions and reasonably normal weather, the quantity available for export and carryover, could range from around 1.3 billion bushels to well over 1.6 billion for the 1975/76 crop year. These availabilities would permit us to meet anticipated export demand with some cushion for stocks. However, if yields should falter again, stronger prices, and shorter supplies would cut wheat feeding and probably stifle exports.

**How Has the Acreage Expansion Been Accomplished?**

Two years of no set-aside restrictions will probably result in 1975's planted wheat acreage being the largest since 1953. This increase has surprised some analysts since there has been talk of "fence row to fence row" planting in some areas the past 2 years. This also alarms those concerned with drought cycles and the possible return to the "dirty thirties."

With the current program, a grower must decide what to plant and how much to plant within the constraints of land and other resources of his operation. Net returns for wheat rank high among crop alternatives, particularly in the low rainfall dryland farming operations of the Great Plains. If he decides to increase wheat plantings, this additional acreage may come from land planted to other crops including forage, land used in fallow rotation, or from initiating a double cropping practice. It appears that the expected expansion may come from all 3 sources.

A look at planted acreage of crops normally competing with wheat shows that there have been some shifts over time. Oat acreage has dropped dramatically to less than half the 1953 level. Grain sorghum and soybeans, on the other hand, may have pushed into wheat areas in eastern Kansas and Nebraska and to some extent in the Southern Plains.

But these are longer term shifts. The sharp expansion in wheat acreage since 1972 appears to have been accomplished to a large extent by the return to production of set-aside land which may have been in fallow, partly at the expense of other crops, expanded double cropping of wheat with soybeans, and partly by using cropland pasture.

On balance, the expansion would restrict the advance in yields because less productive fields are being planted, and fewer fallow acres will be planted. We have also witnessed a slowdown in the trend of ever heavier application of fertilizer.

**1975 Program Details Announced**

Details of the 1975 wheat program as announced follow:

April 11, 1974: A 1975 national wheat allotment of 53.5 million acres was proclaimed. This was down 1.5 million acres from the year earlier allotment. The target

price was held at \$2.05 per bushel. (table 6).

August 22, 1974: The 1975 wheat program would have no set-aside requirements. As earlier announced, there would be no conserving base requirements. Also producers may substitute any non-conserving crop or any conserving crop used for hay or grazing in order to preserve their wheat allotment and to maintain eligibility for any payments under the target price feature.

November 27, 1974: The average loan rate for 1975 crop wheat remains unchanged at \$1.37 per bushel. The

big news was a change in the loan period. Traditionally farmers were faced with a loan maturity date in early spring, regardless of when they took out a loan on their crop. Under the new "anniversary loan program", wheat loans mature on demand, but not later than the last day of the eleventh calendar month following the month in which the loan was made. This program will provide farmers greater flexibility in using the loan program in their marketing strategy. Producers may request loans on their wheat through March 31, 1976.

## THE SITUATION BY CLASS FOR 1974/75

### January 1 HRW Stocks Larger; But Strong Demand in Sight

HRW stocks on January 1 was estimated to be more than 100 million bushels above last winter's estimated 450 million. Stocks in 5 of the principal HRW producing States (Texas, Oklahoma, Kansas, Colorado, and Nebraska) totaled 510 million bushels on January 1, 1975, 28% above a year ago.

Disappearance during July-December fell well below the 700 million bushels estimated for this same period last year. Exports, at around 260 million bushels, showed the sharpest drop, over 40% behind last year's heated pace. There was also a sharp reduction in wheat purchases by feedlots in the Central and Southern Plains because of fewer cattle on feed and high wheat prices relative to sorghum.

This was partially offset by a comeback in HRW mill grind. Ordinary HRW this season is by far the cheapest bread wheat. With the protein content of the crop below normal for the second year in a row, there has been a substantial premium on protein. The apparent scarcity of 13% and higher protein winter wheats quickly led to a price spread last summer of anywhere from 40 to 50 cents over ordinaries. If this spread is maintained, it would be the first time that higher protein wheats commanded that great a premium over ordinary for the entire season. The high prices for higher protein wheats has encouraged the domestic food industry to maximize use of lower protein HRW. This reverses the trend of the past 2 years when an abundance of HRS relative to HRW resulted in a sharp pickup in spring wheat millings at the expense of winter wheats.

The increase in January 1 stocks should not lull buyers into a false sense of security, for a surge in export demand is on the horizon. Outstanding export sales as of December 29, 1974 totaled over 300 million bushels. New sales are expected and additional HRW will go out in the form of flour and products. This is in sharp contrast to 1973/74, when exports tailed off in the second half. Squaring off against the export demand will be the domestic milling and baking industries, which faced with strong wheat prices and heavy premiums for protein, will be competing vigorously for the best buys

until new crop HRW supplies reach the market in late May and June. Feeding during the last 6 months will be negligible. It now appears that all but 125 million bushels of the January 1 stocks will be absorbed by July 1, leaving year ending stocks basically unchanged from their 1974 level.

Normally the HRW harvest begins in late May and by July 1 has moved through Texas and Oklahoma and into Kansas. With larger acreages seeded for 1975 and conditions to date holding up well, the 1975 crop could be 10 to 15% above last year's weather reduced outturn.

### SRW Demand Continues Heavy

This year's recovery in SRW supplies has been matched by a sharp increase in demand, specifically export demand. Apparently, price is what counts. The fact that early season SRW prices were at times the lowest around, spawned a huge export demand. Buoyed by the heavy export movements, July-December disappearance approached 200 million bushels, nearly double the year-earlier level. Exports accounted for roughly half, in sharp contrast to the first half of 1973/74 when limited supplies held exports to only around a fifth of the total disappearance. Domestic use of SRW appeared to hold up pretty well during the July-December period, although feeding was off from a year ago.

January 1, 1975 stocks appear to be at least 50% larger than last year's level of around 60 million bushels, however, demand is expected to continue strong. As of December 29, 1974, the outstanding sales report indicated some 24 million bushels had been sold but not delivered. If most of this moves, exports for the year could climb to around 120 million bushels, largest since 1967/68. The domestic industry will require at least half the January 1 stocks. This should leave year ending stocks somewhat above last summer's low level of 9 million bushels. New crop wheat supplies should come on board in June, as old crop supplies play out.

The SRW producer, apparently responding to favorable wheat prices in relation to other grains, increased wheat acreage again. As an example, planted acreages in 2 of the major SRW producing States, Indiana and Ohio, were up 8% and 6% respectively. This

was on top of a substantial increase in plantings a year ago. Weather permitting, the 1975 SRW crop could easily top 300 million bushels.

### HRS Domestic Use Falters After 2 Heavy Years

A substantially smaller supply, down 29%, and an increase in weather related quality problems are sharply reducing HRS disappearance this marketing year. This is in sharp contrast to the past 2 years when abundant supplies of good quality resulted in a surge in usage.

Total disappearance in July-December 1974 fell to around 150 million bushels, down a third from the same period a year ago. Disappearance was about evenly split between domestic and exports. The smaller supply has reduced our export potential in the face of one of the world's tightest supply situations for protein wheats in years. Canada, our principle competitor for this market, harvested a smaller and lower quality crop in 1974. The extremely tight situation for higher protein winters also is having an affect on the spring wheat market. With the higher protein springs commanding a substantial premium, there has been a concentrated effort by the U.S. milling and baking industries to maximize usage of lower protein wheat, both spring and winter.

January 1 stocks continued to shrink and at slightly

over 200 million bushels were about 20% short of last year's level. Export demand is expected to continue strong with almost 50 million bushels currently on the books and some additional sales expected. Shipments for the year may climb to around 140 million bushels with the limiting factor being the small available supply.

The domestic miller and baker will continue to be an active part of the HRS market, bidding for the higher protein wheat for blending, while maximizing efforts to use lower protein wheats in an effort to hold raw material costs within bounds. Consequently, total domestic use of HRS has been pared to around 160 million bushels, about a fourth below last year. Even then stocks this summer may shrink from the 66 million bushels of a year earlier.

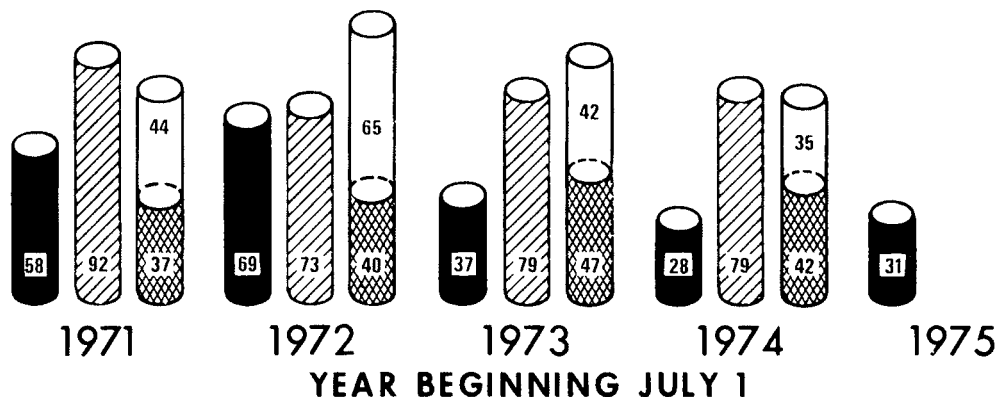

The HRS wheat producer has indicated some caution in planting the 1975 crop. January intentions show 1975 acreage down about 5% from a year ago. Last year in the January and March planting intentions reports he indicated a substantial acreage increase for spring wheat. Due to adverse weather during the spring and an uncertain price outlook, he settled for a 9% increase.

### High Durum Prices Curb Use

A slightly smaller supply and exceptionally high prices relative to hard wheat apparently are affecting

## DURUM WHEAT SUPPLY AND DISAPPEARANCE

MIL. BU.

1973- PRELIMINARY

1974-1975- PROJECTED

USDA

NEG. ERS 913-75 (1)

both domestic use and exports of durum. During July-December, 39 million bushels was debited to the durum accounts. This compared with 44 million for the same period a year ago. Exports lagged with the July-September quarter, especially slow. Mill grind for July-December 1974 appears to be running about 15% behind the July-December 1973 level, although pasta production continues to rise.

In the spring of 1973, consumers appeared to be substituting pasta products for more costly foods to hold down their food budgets. This was substantiated in part by an increase in semolina production. Surveys also indicated that more macaroni, noodles, and spaghetti, were being sold. However, the high prices for durum apparently made the climate more favorable for blending other wheat flours for pasta manufacturing. It now appears that the mill grind of durum has settled back to near a pre-1973 level and the increased demand for pasta products may be built on flours based less and less on durum.

January 1 stocks of 68 million bushels were virtually unchanged from a year ago. As of December 29, outstanding export sales totaled only around 7 million bushels but some additional sales are expected with the final accounting possibly approaching 35 million. The rate of mill grind is expected to continue near the subdued pace of the first 6 months. Seed use should expand if the producers follow through with their planting intentions. Consequently, stocks on July 1 will probably differ little from the year ago level of 28 million bushels.

A number of crop production and stock revisions have been made in the durum supply-demand accounts for the past 2 years. To facilitate the detailing of these changes we have included a quarterly supply distribution table for durum on page 00.

High prices and the hopes for better planting weather apparently are encouraging durum producers as they

indicated a 10% increase in planted acreage in the January plantings report. Last year price uncertainty and unfavorable weather pared the increase in plantings to 23%, from an earlier indicated 47% in January.

### White Wheat Stocks Up

January 1 stocks of white wheat totaled around 140 million bushels, more than a third above last year. Around 105 million bushels were located in the Pacific Northwest. July-December 1974 disappearance totaled an estimated 140 million bushels, somewhat heavier than a year ago. The export demand has been good with around 110 million bushels clearing the first 6 months. In contrast to the small exports of recent years, shipments of eastern white wheat totaled between 6 and 7 million bushels. This is a reflection of the exceptionally large 1974 soft wheat crop in the east. High prices continue to limit feed use of white wheat, but apparently mill demand held up well during the first 6 months.

Total demand during the second half of the year will slow noticeably. As of December 29, 1974, outstanding export sales totaled around 45 million bushels, only around half the sales that are anticipated. Domestic use will continue to plug along, taking around 30 million during the period. If demand projections are realized, stocks of white wheat should total close to 20 million bushels this coming summer.

Turning to 1975 crop prospects, dry weather more than offset the influence of good prices. Consequently, acreage seeded to white wheat in the Pacific Northwest actually declined slightly from last year's level. Winter wheat acreage in the 2 principal white wheat producing States in the East may be up slightly as an increase in Michigan more than offset a decline in New York. Good yields would assure the soft white user another bumper crop to choose from.

## WORLD WHEAT SITUATION <sup>1</sup>

### Smaller World Wheat Crop in 1974

Bright prospects for the 1974 world wheat crop dimmed as the season progressed. Production is now projected at 346 million tons, down 30 million tons from the level estimated last March. This places 1974 about 6% short of the 1973 record. Production of the major exporters—the United States, Canada, Australia, and Argentina—is estimated at 79.5 million tons down around 2%.

Two major developments have impacted on the 1974/75 world wheat situation:

<sup>1</sup> Contributed by William F. Hall, Grains Program Area, CED, ERS. Based primarily on *World Agricultural Situation*, WAS-6, Dec. 1974. *ERS and World Grains Situation: Review and Outlook*, FAS, Feb. 1, 1975.

### 1. The disappointing crops in Canada, Argentina, and the USSR, as shown below:

Region	1973/74 (preliminary)	1974/75 (projected)	Change
	Million tons	Million tons	Percent
United States . . . . .	46.4	48.8	+5.2
Canada . . . . .	16.5	14.2	-14.0
Australia . . . . .	12.1	11.7	-3.3
Argentina . . . . .	6.6	4.8	-27.3
Sub-total . . . . .	81.6	79.5	-2.6
W. Europe . . . . .	50.7	55.9	+10.3
USSR . . . . .	109.7	83.8	-23.6
E. Europe . . . . .	31.6	33.4	+5.7

2. The deteriorating food situation in South Asia. India's 1974 wheat crop was down 10.5% and total food grain production (including millet and pulses) for 1974/75 will be off from a year ago.

The decline in crop conditions has placed the world's wheat supply for 1974/75 under last season's tight level. In spite of high grain prices and unfavorable economic indicators—stagnating or slowing economic growth and foreign exchange shortages—the need for food prevails and demand is expected to remain strong in most regions. Estimated 1974/75 world wheat trade, at 71.4 million tons, is about 5% above 1973/74. The Soviet Union is expected to import less but shipments to South Asia and West Asia should rise. Estimates of PRC imports are lower than earlier expected because of delayed deliveries.

#### **Canada's Wheat Crop Down 14%; Quality Also Lower**

Canada's crop for 1974 is now estimated at 14.2 million tons, down 14% from 1973. Red spring totaled 11.9 million tons, down 18% from a year ago. Durum production, however, at 1.7 million tons, surged 18%. Large areas of the prairies were hit by frost before the crop was fully matured. This down graded the quality of much of the crop. The Grain Inspection Division of Agriculture Canada estimates that for the 1974 Red Spring Crop, 17% will grade No. 1 CWRSW, 25% No. 2; 29% No. 3; and 26% No. 3 Canada utility. This is in sharp contrast to a year ago when 85% of the crop graded No. 1 and 2 CWRSW. But old crop stocks of around 10 million tons on August 1 were of higher quality, reducing the strain on protein wheat supplies from this year's poor crop. About 3 to 4 million tons are expected to be used for feed.

Exports for FY 1974/75 are estimated at 10.5 million tons, down about a tenth from a year ago. This calls for some reduction of stocks at the end of the marketing year. Canada's principal markets are PRC, USSR, Japan, and the U.K.

#### **Argentina's Small Crop Holds Exports Down**

Argentina's wheat crop is now estimated at only 4.8 million tons, down 27% from last year. Planted area was up 20%, but the prolonged drought in southern Buenos Aires Province and adjoining areas of La Pampa Province, where over half the Argentine crop is grown, reduced the crop. Exports for July-June 1974/75 are estimated at about 1.7 million tons.

#### **Australia's Crop Down 3% but Larger Than Earlier Expected**

Australia's 1974 wheat crop is estimated at 11.7 million tons. Area was not as large as anticipated due to excessive moisture at planting; however, quality should surpass the rain-damaged 1973/74 crop. Exports during FY 1974/75 may total 9 million tons, up around 70% from 1973/74. Australia's principal markets for wheat in FY 73/74 were Egypt, USSR, and the PRC. The pattern this season will likely be about the same.

#### **USSR Crop Down a Fourth as Spring Crop Withered**

The USSR announced a total grain and pulse crop for 1974 of 195.6 million tons, compared with the record 222.5 million tons harvested in 1973. It is estimated that 1974 wheat output was 83.8 million tons, down almost 24% from the 1973 record, as drought in the spring wheat area was especially damaging. The USSR will import an estimated 3.5 million tons of wheat during the 1974/75 season.

#### **People's Republic of China (PRC) Continues Large Imports**

Because of a long dry spell last winter and early spring, winter wheat production in 1974 was somewhat smaller than the record harvest in 1972. Potential disaster was largely averted due to irrigation efforts in the North China Plain, a major winter wheat area, as well as the use of improved seeds, increased application of fertilizer, and some increase in acreage. A larger spring wheat crop was harvested but since it accounts for only 10-20% of the total crop, the increase was not enough to offset the drop in winter wheat. China's total grain imports during 1974/75 are estimated at about 7.5 million tons, about the same as a year earlier.

#### **Record Wheat Harvest in Western Europe**

Western Europe's 1974 wheat output is estimated at a record 55.9 million tons, up 10% from 1973. Reflecting the recent decline in world grain prices, the EC recently set the import levy per metric ton for wheat at \$6.93 and the wheat export tax has been reduced from \$94.50 to \$37.80 per ton.

#### **Wheat Prices Down**

C.I.F. Rotterdam prices for U.S. and Canadian wheats have moved down since November, running around \$5.25 per bushel in late January.

## HIGHLIGHTS OF THE RYE SITUATION

### Supply and Use Down Sharply in First Half

The final tally of the 1974 rye crop indicated production at 19.3 million bushels, 27% below the previous year and the smallest since 1953. Harvested acreage was down 13% and yields, at 21.5 bushels, was down nearly 4 bushels to the lowest level since 1964. Dry weather generally plagued crop development in the important Northern Plains States and severely hurt the Southern Plains crop.

#### Rye: Supply and distribution

July 1 stock .....	33.3	11.0
Production .....	26.3	19.3
Imports .....	—	—
Total supply .....	<sup>1</sup> 59.5	30.3
Exports .....	22.0	3.9
Food .....	3.1	2.9
Seed .....	4.5	4.1
Industrial .....	1.1	.7
Feed .....	7.4	6.7
Total disappearance .....	38.1	18.3
January 1 stocks .....	21.4	12.0

<sup>1</sup>Total may not add due to rounding.

The supply for the 1974/75 marketing year, at 30 million bushels, is the smallest since 1952. First-half usage was below year-earlier levels for all items. Exports totaled 3.9 million bushels, compared with 22 million a year ago when Soviet purchases were shipped. Domestic grind was 8% below a year ago while use in the distilling industry was off about two-fifths.

Total demand for 1974/75 will be well below last season primarily because of smaller exports. But use will probably be in excess of the 1974 harvest, leading to another cutback in carryover next summer.

Prices of No. 2 rye at Minneapolis since October have followed the same softening tendency as other grains. However, since mid-December they have been relatively firm, ranging from \$2.90 to \$3.00 per bushel, while other grains have continued to ease. This would appear to place rye in a less favorable position for blending with wheat flour. The average price received by farmers for 1974/75 was estimated at \$2.55 per bushel over a third above a year ago's farm price.

### Winter Rye Seedings Smallest Since 1929

Seedings of rye last fall totaled 3,166,000 acres—1% less than the 1974 crop plantings and one of the smallest acreages of this century. This is even more relevant when considering acreage that will be harvested, since the harvesting rate has declined over a fourth to only 28% as rye has become more important as a forage crop. Georgia leads the nation in planted acreage but only around a fourth is harvested for grain. Unfavorable planting conditions and a shift to planting wheat are the

probable reasons for the cutback in rye acreage. Planted acreage for 1975 fell 48% in South Dakota, where extreme drought was responsible; Oklahoma, indicated 25% less acreage. Partially offsetting were gains of 20% in Georgia, a record high acreage, and 16% in North Dakota.

Moisture was generally short in the Northern Great

Plains at planting time, which slowed progress and restricted growth of early seeding. Many farmers were not able to seed rye in South Dakota because of dry soils and much of the acreage that was planted has poor stands. Rye conditions are mostly good to excellent in Oklahoma and the High Plains of Texas as fall moisture supplies have been adequate to surplus.

Rye: Seeded and harvested acreage and rate of abandonment

Year	Seeded	Harvested	Rate of abandonment
	<u>1,000 acres</u>		<u>Percent</u>

Season																

1/ Adjusted for transshipments of U.S. wheat through Canada.

2/ Includes bulgar, rolled wheat, semolina and macaroni.

3/ Residual; approximates feed use and includes negligible quantities used for distilled spirits and beer.

4/ Partly estimated.

<sup>1/</sup> July-December based on current operating reports, annual taken from fiscal reports.

<sup>2/</sup> All sealed under bond wheat has been released without priority.

<sup>3/</sup> Sales for unrestricted use at the minimum price, which is the market price or not less than the formula prices at designated terminals, or outside of designated terminals, plus monthly markups.

Agricultural Stabilization and Conservation Service.

Table 6.--Wheat programs: Comparison of provisions for 1973-75 wheat crops

Item	1973 Program 1/	1974 Program 2/	1975 Program 2/
National wheat allotment	Not applicable	55.0 million acres	53.5 million acres.
National domestic wheat allotment	18.7 million acres	Not applicable	Not applicable
Loan	\$1.25 per bushel	\$1.37 per bushel	Same as for 1974
Domestic certificate	Difference between average price received by farmers in the first 5 months (July-Nov. 1973) of the marketing year and 100 percent of wheat parity on July 1, 1973.	Not applicable	Not applicable
Total support or guarantee to program participant for certificate production	100 percent of parity (\$3.39)	Not applicable	Not applicable
Guaranteed return or target price	Not applicable	Target price of \$2.05 per bushel. The guaranteed payment if any will be based on the differences between the target prices and the 5 month weighted average farm price.	Same as for 1974
Production eligible for loan	Total production on participating farm	All production (allotment or participation; not a requirement for loan)	Same as for 1974
Production eligible for domestic certificates	Production on 100 percent of farm domestic wheat allotment	Not applicable	Not applicable
Computation of guaranteed return or target payments	Not applicable	Payment rate times farm allotment times established yields.	Same as for 1974
Preliminary payment	75 percent of estimated value of certificates soon after July 1, 1971. Final payments made after December 1.	No preliminary payment. Any payment due will be made after December 1, 1974.	No preliminary payment. Any payment due will be made after December 1, 1975.
Payment Limitations	Maximum value of 1973 wheat certificate plus voluntary set-aside payments to any person \$55,000.	Total payments under wheat, feed grain, and cotton programs limited to \$20,000 per person, excluding resource adjustments and payments.	Same as for 1974
Set-aside requirements	86 percent of farm domestic allotment for producers who elect to participate in voluntary set-aside. No set-aside required for other producers.	No set-aside required	Same as for 1974
Compensation for required set aside	Value of wheat certificates and loan eligibility	Not applicable	Not applicable

See footnotes at end of table.

--Continued

Table 6.--Wheat programs: Comparison of provisions for 1973-75 wheat crops--continued

Item	1973 Program <u>1/</u>	1974 Program <u>2/</u>	1975 Program <u>2/</u>
Limitations on acreage planted to wheat	Participant who sets aside cropland equal to the required percentage of his domestic wheat allotment and maintains his conserving base may plant all the remaining cropland on the farm to wheat or any other crop he wishes without loss of certificates (planting of quota crop limited by other persons). Voluntary set aside requirement limited total wheat acreage planted for harvest.	No limit on wheat acreage	Same as for 1974
Planting required to prevent loss of allotment	Producer must plant at least 90 percent of domestic allotment to wheat to maintain base. Base reduced by amount of underplanting up to 20 percent.	Participants required to plant 90 percent of allotment to wheat or a broad range of substitute crops or lose part of allotment.	Same as for 1974
Substitution	Any producer who sets aside cropland equal to the required percentages of his base and allotment and maintains his conserving base can plant his entire acreage to wheat, corn, sorghum, barley or soybeans without loss of payments, certificates, base acreage or allotment. A producer with only a base or only an allotment can participate in one program and plant all wheat or all feed grains without loss of benefits, base or allotment.	Any non conserving crop, and any conserving crop used for hay or grazing or other crops designated by the Secretary can be substituted to preserve history.	Same as for 1974
Conserving base	Acreage diverted must be in addition to the conserving base, i.e., average acreage of conserving crops in 1959 and 1960.	No conserving base requirements	Same as for 1974
Farm program yield used to calculate benefits	Projected from 1967-71 average	Projected from 1968-72 average	Projected from 1969-73 average
Loan availability	Until one month before loan maturity date	Same as for 1973	Until March 31, 1976
Loan maturity	April 30 except May 31 for States of Idaho, Minnesota, Montana, North Dakota, Oregon, Washington, and Wyoming.	Same as for 1973	Not later than the last day of the eleventh calendar month following the month in which the loan is disbursed.

1/ As announced under the Agricultural Act of 1970.

2/ As announced under the Agriculture and Consumer Protection Act of 1973.

World total	340.7	357.5	361.4	360.9	354.6
<b>Stocks, ending: 3/</b>					
World total	73.5	50.9	56.3	46.5	47.6

1/ Includes transshipments through Canadian ports, excludes products other than flour.

2/ Production data includes all harvests occurring within the July-June year shown, except that small grain crops from the early-harvesting Northern Hemisphere areas are "moved forward"; i.e.; the May 1974 harvests in areas such as India, North Africa and southern USA are actually included in "1974-75" accounting period which begins July 1, 1974.

3/ Consumption and stocks data are based on an aggregate of differing local marketing years. Stocks data are not available for the USSR, the People's Republic of China and parts of Eastern Europe, but the world total has been adjusted for estimated year-to-year changes in the USSR.

4/ Includes estimated waste due to excess moisture and foreign material.

Table 19.--Wheat: World wheat supply and distribution, marketing years 1965-75 <sup>1/</sup>

Year	Area	Yield	Beginning	Production	Total	Consumption
	Harvested		Stocks <sup>2/</sup>		Exports	Total <sup>3/</sup>
	Million Ha.	Qu./Ha.		Million metric tons		
1965/66	216.4	12.2	70.6	263.3	61.1	282.2
1966/67	214.7	14.1	51.7	303.9	57.3	279.0
1967/68	219.3	13.4	76.6	293.4	53.1	288.3
1968/69	224.5	14.5	81.7	325.2	50.0	300.5
1969/70	217.7	14.1	106.4	306.2	55.3	319.0
1970/71	206.0	15.0	93.6	309.5	56.3	330.7
1971/72	211.6	16.2	72.4	341.8	56.1	340.7
1972/73	208.4	16.1	73.5	334.9	72.3	357.5
1973/74 <sup>4/</sup>	217.4	16.9	50.9	366.8	70.5	361.4
1974/75 <sup>5/</sup>	221.5	15.6	56.3	345.9	72.4	354.6
1975/76 <sup>5/</sup>			47.6			

<sup>1/</sup> Data in this table are based on an aggregate of differing local marketing years, and will therefore differ from July-June data appearing elsewhere in this report.

<sup>2/</sup> Stocks data are only for selected countries and exclude such important countries as USSR, the People's Republic of China, and part of Eastern Europe for which stocks data are not available; the aggregate stocks levels have, however, been adjusted for estimated year-to-year changes in USSR grain stocks.

<sup>3/</sup> For countries for which stock data are not available, or for which no adjustments have been made for year-to-year changes, consumption estimates assume a constant stock level.

<sup>4/</sup> Preliminary.

<sup>5/</sup> Projected.

1/ Includes allowance for loans outstanding and purchases by the Government valued at the average loan and purchase rate. Simple average for Minneapolis No. 2 and Winnipeg No. 3.

ANNUAL LIST OF TABLES FOR CALENDAR YEAR 1974

WHEAT:

Issue

Supply and Distribution:

Condensed table and by classes .....	All issues
By quarters .....	All issues
United States, Canada, Australia, and Argentina .....	All issues
World, marketing years .....	February, August, November

Acreage, Yield and Production:

U.S. acreage, yield, and production .....	February, August
World acreage, yield and production, by countries .....	February
World production, trade and stocks, annual 1970-73 .....	All issues
U.S. acreage allotment by states .....	November.

Stocks

Total stocks in all positions, by quarters, United States .....	February, August
---	------------------

CCC: Price Support Operations, Dispositions and Stocks

Price support operations, historical .....	May, August
Loan activity, sales and dispositions, summary .....	All issues
Crop loan activity, by months, historical .....	All issues

Percent of farm marketings, by months .....	May
---	-----

Disposition, Farm .....	May
-------------------------	-----

Exports, Including Flour

United States and World Trade:

Current indicators of export movement, by classes, programs and coastal areas .....	All issues
Inspections for export, by classes and country of destination .....	August
Exports under U.S. Government programs .....	November
Wheat and flour: Exports by country of origin .....	May
Exports to Communist countries, fiscal years .....	May
Undelivered export sales .....	February, May, August
Wheat and flour exports by country of destination .....	November
World wheat and flour trade, July-June .....	All issues
Inspections for export, by programs and country of destination .....	February, August

Prices

Cash prices for leading classes at major markets .....	All issues
Wheat and flour price relationships .....	All issues
White bread, flour and wheat prices and related data .....	All issues
Cereal and bakery products, retail price index .....	All issues
Export prices and payment rates .....	All issues
Rotterdam, c.i.f. quotations, by months .....	All issues
Farm, loan rate and feed grain in region .....	All issues

RYE:

Supply and Distribution

Supply and distribution, by quarters .....	All issues
Supply and distribution, condensed table .....	All issues

Acreage, Yield and Production

Acreage, yield and production, United States .....	February, August
Disposition; Farm .....	May

Stocks

Total stocks in all positions by quarters, United States .....	February, August
--	------------------

CCC Price support operations, historical .....	May, August
